InflatIQ is a research report generated using data from various internet sources to best predict inflation in a given month before it is reported by the BLS. The goal of the research is to beat the betting markets by having asymptomatic information, giving leverage to our positions. We believe that InflatIQ can generate quality information through a variety of sources, including but not limited to; grocery, oil, gold, commodity, car, and wage increases.

Currently there exist various inputs to gather this information separately. However, InflatIQ hopes to aggregate this data into one daily report to give investors an upper hand on inflation information. We also believe that our research will serve a pivotal role in eliminating arbitrage as inflation information is limited to the monthly BLS reports.

By leveraging real-time web scraping, machine learning models, and economic analysis, InflatIQ aims to provide accurate and actionable inflation forecasts. Our methodology is rooted in transparency and rigorous statistical validation, ensuring that our predictions remain reliable and adaptive to market shifts.

We understand the importance of timely and precise economic indicators for traders, businesses, and policymakers. That is why InflatIQ prioritizes continuous improvement by integrating new data sources, refining our models, and maintaining an open discourse with the financial community.

In an era where information asymmetry dictates market movements, InflatIQ seeks to democratize access to real-time inflation insights. Through our daily reports, we aim to empower investors with knowledge that is typically delayed or inaccessible, fostering a more efficient and informed financial ecosystem.
